SGA series motors

Enhanced performance cast iron units

SOLUTIONS, not just products

Specialists in Electric Motors, Geared Motors & AC Drives

At CMG we offer customised packages to the most demanding industrial markets. Our success is built on a strong commitment to our customers' needs and a willingness to find the best solution possible. We have been in business since 1948 so you can be confident our expertise and experience is second to none.

With over 650 staff around the globe, our branches extend across Australia, New Zealand, Asia Pacific, South Africa, Europe and the Middle East.

We have the capability to value-add our products through partnerships with leading international companies whose technical skills are equal to ours, including Gear Motors from Reggiana Riduttori and NORD, and AC Drives from VACON. In return we offer these companies superior technical support that complements their own R&D capabilities.

Our manufacturing facility in Melbourne, Australia, demonstrates our commitment to efficient automated manufacturing processes. This facility includes a NATA & ILAC accredited laboratory which offers complete design and testing services.

"We specialise in an extensive range of Electric Motors, Geared Motors and AC Drives. Offering a "complete package" ensures our customers get the most efficient, cost effective solution possible."

Introduction

This catalogue details the complete range of CMG SGA series motors. Standard SGA motors are three phase squirrel cage TEFC (Totally Enclosed Fan Cooled), with IEC frame sizes from 71 to 355, with CENELEC frame allocation as standard. They combine excellent electrical characteristics with the robust strength of cast iron.

The standard design includes single speed 2,4,6 and 8 pole as well as a comprehensive selection of 2 speed motors. In addition to the standard design, the range includes:

- SGAA** - Alternative frame allocation
- SGAB** - Brake motors
- SGAE** - Hazardous location Ex e
- SGAN** - Hazardous location Ex nA (formerly Ex n)
- SGAD** - Hazardous location Ex tD (formerly DIP)
- SGAS** - Smokespill application (formerly SGASS)
- SGAC** - Cooling tower application (formerly SGACT)
- SGAR** - Airstream rated for Axial flow fans
- SGAP** - Pad mount motors

All units are supplied with F Class insulation, with temperature rise being limited to less than 80K (unless otherwise marked). This provides the end user with a wide safety margin under general operating conditions.

In addition we also offer motors wound with H Class insulation, and temperature rise still limited to 80K.

- SGAH** - High ambient temperature application
- SGAHS** - H Class smokespill application

Additional protection is provided by installation of thermistors in all units from 160 frame upward to continuously protect the winding.

The conservative rating of CMG type SGA motors provides additional operational safeguards, ensures long unit life, and renders this series inherently suitable for most arduous mining, industrial or agricultural applications.

Hazardous area certification

SGA motors in frames 71 to 280 are certified for use in hazardous locations as per IEC Ex and ATEX requirements, with 315 frame certificate pending (Ex nA and Ex tD only).

- The following certificates are currently available:
- | | | |
|-------------|--------------------|---------------------|
| IEC | IECEx TSA 06.0034X | Ex e, Ex nA, Ex tD |
| ATEX | Sira 06ATEX9112X | EX tD |
| | Sira 06ATEX4111X | Ex nA, Ex nA/ Ex tD |
| | Sira 06ATEX3110X | Exe, Ex e/ Ex tD |

Standards and specifications

The main dimensions and rated outputs of CMG type SGA motors generally conform to International Standards IEC60034, IEC60072 and Australian Standard AS1359.

Efficiency

The SGA motor range exceeds requirements of European Eff 2 and correspond to IE1 (Standard Efficiency) of the new international standard IEC 00034-30. For Eff 1 motors, refer to CMG's HGA and PPA series catalogues.

Product code specification

When placing an order the motor product code should be specified. The product code of the motor is composed in accordance with the following example:

M	3	2	0	0	1	5	0	3	S	G	A	E	/	4	0	5
1	2	3	4 - 8					9	10 - 12		13...	Suffix				

Position 1
M = metric frame size

Position 2
Winding design
3 = Standard three phase motors
A = 2 speed fan duty single winding
B = 2 speed fan duty separate windings
C = 2 speed constant torque single winding
D = 2 speed constant torque separate windings

Position 3
Number of poles

2 = 2 poles	F = 2/6 poles	M = 4/12 poles
4 = 4 poles	G = 2/8 poles	N = 6/8 poles
6 = 6 poles	H = 2/10 poles	O = 6/10 poles
8 = 8 poles	I = 2/12 poles	P = 6/12 poles
A = 10 poles	J = 4/6 poles	Q = 8/10 poles
C = 12 poles	K = 4/8 poles	R = 8/12 poles
E = 2/4 poles	L = 4/10 poles	S = 8/16 poles

Positions 4 to 8
Rated power output*
(kW x 100)
* Refers to high speed for 2 speed motors

Position 9
Mounting arrangements

1 = V1	5 = B5	8 = B3/B14B
3 = B3	6 = B3/B14A	9 = B14B
4 = B3/B5	7 = B14A	0 = for Pad Mount only

Positions 10 to 12
Series
SGA = CMG SGA series

Positions 13...*
Series variation

Blank = Standard	G = Suit NORD gearbox
1 = High output design	H = H Class insulation
A = Alternative frame allocation	L = LHS terminal box
B = Brake motor	N = Ex nA
C = Cooling tower	P = Pad mount
D = Ex tD	R = Airstream rated
E = Ex e	S = Smokespill
F = Flying leads	T = Top terminal box

* Multiple letters indicate multiple variation.

Suffix
Winding design

/385 = 380V / 50Hz	/A05 = 1000V / 50Hz
/405 = 400V / 50Hz	/B05 = 1100V / 50Hz
Blank = 415V / 50Hz	/386 = 380V / 60Hz
/525 = 525V / 50Hz	/446 = 440V / 60Hz
/695 = 690V / 50Hz	

Mechanical design

Mountings

CMG SGA motors are available in the mounting arrangements listed in the table below:

Foot mount

		
B3 (IM1001) [SGA 71 - 355]	V5 (IM1011) [SGA 71 - 280]	V6 (IM1031) [SGA 71 - 280]
		
B6 (IM1051) [SGA 71 - 180]	B7 (IM1061) [SGA 71 - 180]	B8 (IM1071) [SGA 71 - 180]

Large flange

		
B5 (IM3001) [SGA 71 - 250]	V1 (IM3011) [SGA 71 - 355]	V3 (IM3031) [SGA 71 - 180]

Large flange and feet

		
B3/B5 (IM2001) [SGA 71 - 355]	V1/V5 (IM2011) [SGA 71 - 180]	V3/V6 (IM2031) [SGA 71 - 180]

Small flange (face)

		
B14 (IM3601) [SGA 71 - 160]	V18 (IM3611) [SGA 71 - 160]	V19 (IM3631) [SGA 71 - 160]

Small flange (face) and feet

		
B3/B14 (IM2101) [SGA 71 - 160]	V5/V18 (IM2111) [SGA 71 - 160]	V6/V19 (IM2131) [SGA 71 - 160]

Note: Bearing arrangement may require review for vertical shaft mounting.

Protection

For vertically mounted motors

Motors to be mounted with the shaft vertically down must be provided with a suitable cover (available on request) to ensure foreign bodies are prevented from entering the motor.

Special care is necessary in fitting protective covers to ensure air flow is not impeded (refer to Cooling section on page 7).

To maintain IP rating, special additional measures may be required to protect the motor against the ingress of water or foreign bodies. Please contact CMG for further information.

Against solar radiation

High solar radiation will result in undue temperature rise. In these circumstances motors should be screened from solar radiation by placement of adequate sunshades which do not inhibit air flow.

Degree of protection

Standard levels of enclosure protection for all SGA frame sizes for both motor and terminal box is IP55, with IP56, IP65 and IP66 available on request.

Enclosure designations comply with IEC or AS60529. The enclosure protection required will depend upon the environmental and operational conditions within which the motor is to operate.

IP standards explanation

IP	5	5
1-2	3	4

Positions 1 and 2

International protection rating prefix

Position 3
First characteristic numeral
Degree of protection of persons against approach to live parts or contact with live or moving parts (other than smooth rotating shafts and the like) inside the enclosure, and degree of protection of equipment within the enclosure against the ingress of solid foreign bodies.

- 4 = *Protected against solid object greater than 1.0 mm:* Wires or strips of thickness greater than 1.0 mm, solid objects exceeding 1.0 mm
- 5 = *Dust protected:* Ingress of dust is not totally prevented but it does not enter in sufficient quantity to interfere with satisfactory operation of the equipment.
- 6 = *Dust tight:* No ingress of dust.

Position 4

Second characteristic numeral

- 4 = *Protected against splashing water:* Water splashed against the enclosure from any direction shall have no harmful effect.
- 5 = *Protected against water jets:* Water projected by a nozzle against the enclosure from any direction shall have no harmful effect.
- 6 = *Protected against heavy seas:* Water from heavy seas or water projected in powerful jets (larger nozzle and higher pressure than second numeral 5) shall not enter the enclosure in harmful quantities.

Materials and construction

Element	Motor frame size	
	71-180	200-355
Frame	Cast iron	Cast iron
Endshields	Cast iron	Cast iron
Terminal box	Cast iron	Cast iron
Fan	Plastic (alloy available) (cast iron available)	Sheet steel blades mounted on cast iron carrier
Fan cowl	Sheet steel	Sheet steel
Fasteners	Corrosion protected	Corrosion protected

Shaft

SGA motors have standard shaft extension lengths and are provided with standard key, and drilled and tapped hole. Non standard shaft extensions are available upon special order, with shaft design outlined on a detailed drawing.

Shaft extension run out, concentricity and perpendicularity to face of standard flange mount motors, comply with normal grade tolerance as specified in IEC 60072-1 and AS1359. Precision grade tolerance is available upon special order.

Finish

Standard SGA motor color is RAL 7012 Basalt Grey. Other colors are also available. All castings and steel parts are provided with a prime coat of rust-resistant paint.

The finishing coat of enamel paint is sufficient for normal conditions, however special paint systems can be provided to accommodate stringent requirements for motors in corrosive environments. Special coatings are needed to resist such substances as acid, salt water and extreme climatic conditions.

Different colors and paint systems apply for varieties as described later in this catalogue.

Terminal box

SGA motors have a cast iron terminal box with a one piece nitrile rubber barrier gasket between terminal box and motor, and a flat gasket under the terminal box lid. The earthing arrangement is available within the terminal box.

As standard the terminal box is mounted on the right hand side when viewed from drive end. Motors are also available with terminal boxes on the left hand side or top.

→ indicates conduit entry position

Conduit entries for motor frame sizes 71 to 280 are provided tapped, with thread details set out below. Motor frame sizes 315 and 355 are provided with a blank removable gland plate for machining as required.

Motor frame	Dimensions			Entry/pitch		Number of entries
	HF	HG	LT ¹⁾	Standard	Alternative*	
71 ²⁾	135	127	20	M20 x 1.5	M20 x 1.5	2
80 ³⁾	127	135	40	M20 x 1.5	M20 x 1.5	2
90S ³⁾	127	135	45	M20 x 1.5	M20 x 1.5	2

280	270	235	90	M50 x 1.5	M50 x 1.5	2
315	355	300	90	10 mm Gland plate	M63 x 1.5	Nii/2
355	355	300	125	10 mm Gland plate	M63 x 1.5	Nii/2

* Supplied as standard in South Africa.

¹⁾ Dimension LT should be confirmed for SGAL motors.

²⁾ Frame 71 only available with top mounted terminal box.

³⁾ Conduit entry faces to rear of motor for frames 80 & 90.

The terminal box can be rotated through 4 positions, 90° apart. Terminal boxes are fitted with conduit entries arranged as follows:

SGA - Standard²⁾³⁾

SGAR - Rear

SGAT - From RHS when viewed from drive end

²⁾ Frame 71 only available with top mounted terminal box.

³⁾ Conduit entry faces to rear of motor for frames 80 & 90.

Cooling

SGA motors are totally enclosed fan cooled (TEFC) over an externally ribbed frame, with free movement of internal air by rotation of rotor blades, which is in accordance with IC0141 of IEC 60034-6 and AS1359.106.

Cooling air flows from the non-drive-end to the drive end. The fan is independent of the direction of rotation of the motor.

When the motor is installed care should be taken not to impede the air flow into the motor cowl. As a guide the following minimum dimension BL should be adopted.

Motor frame	Dimension BL [mm]
71-100	15
112-132	30
160-180	40
200-280	50
315-355	65

For details of motors fitted with extended leads please refer to page 33.

Bearings

As standard, frame sizes 71 to 180 have high quality deep groove ball bearings with full contact seals. Bearings are prepacked with grease which, under normal operating conditions, provide a high degree of operational reliability. Frame sizes 200 to 355 have high quality bearings with facilities to enable replenishment of the lubricant during operation. Grease nipples are fitted to endshields with the grease relief chute blanked off by a removable plate.

The table below sets out the permissible forces that can be applied to the motor shaft. Values assume the occurrence of only radial or axial loading. Point of application of the force is assumed to be at the tip of the shaft. Rotor weights have already been allowed for in the calculation of radial and axial loads. These loads are applicable for horizontal mounting only. The values are calculated on the basis of basic rating life or fatigue life L_{10} of 40,000 hours. Adjusted rating life for specific applications can be calculated if all influencing factors are known.

Greater axial forces can be tolerated if the motors are provided with angular contact ball bearings. Note that in such cases, the axial force must operate in one direction.

High capacity bearings

For frame sizes 200 to 280 in applications with increased radial force, cylindrical roller bearings can be substituted for ball bearings at the drive end, according to the accompanying table. When a roller bearing is fitted to the D-end, the N-end ball bearing is locked with a circlip to prevent axial movement. Note that the use of roller bearings is not recommended for 2 pole motors.

Permissible radial force - high capacity

Motor frame	D-end Roller	N-end Ball	Permissible radial force [N]		
			4 pole	6 pole	8 pole
200	NU312	6312	5825	6730	7455
225	NU313	6313	6015	7055	7740
250	NU314	6314	7295	8420	9315
280	NU317	6317	13445	15320	16770

* SGAA D-end bearing = NU6315

Lubrication

SGA motors standard bearings are lubricated with lithium based rolling contact bearing grease suitable for operation within the cooling air temperature range of -20°C to +55°C. For operation outside this temperature range special lubricants are required. SGAAH, SGAS and SGAAHS motors use Magnalube G grease.

Special lubricants or additional maintenance may be required in the case of motors exposed to comparatively high degrees of pollution, high humidity, increased or changed bearings loads, or prolonged continuous operation.

Permissible radial and axial forces – standard B3 mounted motors

Motor frame	Bearing		Permissible radial force [N]				Permissible axial force [N]			
	D-end	N-end	2 pole	4 pole	6 pole	8 pole	2 pole	4 pole	6 pole	8 pole

¹⁾ Based on maximum grease service life of 20,000 hours ²⁾ Refer to Nameplate / Motor to confirm Bearing size.

Vibration, balancing and noise

Vibration

SGA motors fall within the limits of vibration severity set out in standard IEC 60034-14 which are listed below. As specified in the standard, these values relate to rotating machinery measured in soft suspension.

Vibration severity limit, Level N

Motor frame	Maximum RMS vibration velocity [mm/s]
71	1.6
80	1.6
90	1.6
100	1.6
112	1.6
132	1.6
160	2.2
180	2.2
200	2.2
225	2.2
250	2.2
280	2.2
315	2.8
355	2.8

Balancing

Rotors have been dynamically balanced with a half key. Pulleys or couplings used with motors must also be appropriately balanced.

Noise

Noise levels for SGA motors comply with limits set by IEC 60034.9 and AS1359.109. SGA sound pressure levels at 1 metre (Data relates to motors tested at no load) are set out in the table (above right).

CMG Motors | SGA 0912 (edition 7.2.0)

Sound pressure level

Output [kW]	Sound pressure level dB(A) at 1 metre			
	3000 r/min	1500 r/min	1000 r/min	750 r/min

250	95	92	88	-
315	95	92	-	-

Electrical design

As standard, SGA motors have the following design and operating parameters. Performance data is based on this standard. Any deviation should be examined and performance values altered in accordance with the information provided in this section.

Three phase, 415V, 50Hz

Ambient cooling air temperature, 40°C

Altitude - 1000m

Duty cycle - S1 (continuous)

Rotation - Clockwise viewed from drive end

Connection - 240 volt Delta/415 volt Star (3kW and below)
- 415 volt Delta/720 volt Star (4kW and above)

Voltage and frequency

Standard SGA motors are designed for a power supply of three phase 415V, 50Hz. Motors can be manufactured for any supply between 100V and 1100V and frequencies other than 50Hz. Standard SGA motors wound for a certain voltage at 50Hz can also operate at other voltages at 50Hz and 60Hz without modification, subject to the changes in their data (see table right).

Motor wound for 50Hz at rated voltage -	Connected to	Data ⁹ in percentage of values at 50Hz and rated voltage							
		Output	r/min	I _N	I _L /I _N	T _N	T _L /T _N	T _B /T _N	
380V	400V 50Hz	100	100	95	110	100	110	110

* Not applicable for motors with F class temperature rise.
Note: This table is not applicable for hazardous area motors.

- ¹⁾ I_N = Full load current T_N = Full load torque
I_L/I_N = Locked rotor current/ full load current T_L/T_N = Locked rotor torque/ full load torque
T_B/T_N = Breakdown torque/full load torque

Standard torque values for alternative supplies are obtainable only with special windings. For these purpose-built motors the performance data is the same as for 415V motors except for the currents which are calculated with the accompanying formula:

$$I_x = \frac{415 \times I_N}{U_x}$$

Where:

I_x = Current

I_N = Full load current at 415 volt

U_x = Design voltage

Temperature and altitude

Rated power specified in the performance data tables apply for standard ambient conditions of 40°C at 1000m above sea level. Where temperature or altitude differ from the standard, multiplication factors in the table below should be used.

Ambient temperature	Temperature factor	Altitude above sea level	Altitude factor
30°C	1.06	1000m	1.00
35°C	1.03	1500m	0.98
40°C	1.00	2000m	0.94
45°C	0.97	2500m	0.91
50°C	0.93	3000m	0.87
55°C	0.88	3500m	0.82
60°C	0.82	4000m	0.77

$$\text{Effective Power} = \text{Rated Power} \times \text{Temperature Factor} \times \text{Altitude Factor}$$

Example 1

Effective Power required = 15kW
 Air temperature = 50°C (factor 0.93)
 Altitude = 2500 metres (factor 0.91)

$$\text{Rated power required} = \frac{15}{0.93 \times 0.91} = 17.7\text{kW}$$

The appropriate motor is one with a rated power above the required, being 18.5kW.

Example 2

Rated power = 11kW
 Air temperature = 50°C (factor 0.93)
 Altitude = 1500 metres (factor 0.98)

$$\text{Effective Power} = 11 \times 0.93 \times 0.98 = 10.0\text{kW}$$

Rotation

For clockwise rotation, viewed from drive end, standard three phase SGA and SGAT motor terminal markings coincide with the sequence of the phase line conductors.

For counter clockwise rotation, viewed from drive end, two of the line conductors have to be reversed. This is made clear in the accompanying table.

Non-standard SGAL series motors with the terminal box located on the left, viewed from drive end, have a counter-clockwise rotation for corresponding markings. Reversing two of the line conductors will reverse the rotation to clockwise.

Terminal box location (viewed from drive end)	Sequential connection of L1, L2 and L3	Direction of rotation
Right or Top	U1 V1 W1	Clockwise
	V1 U1 W1	Counter-clockwise
Left	V1 U1 W1	Clockwise
	U1 V1 W1	Counter-clockwise

Duty

SGA motors are supplied suitable for S1 operation (continuous operation under rated load). When the motor is to operate under any other type of duty the following information should be supplied to determine the correct motor size:

- Type and frequency of switching cycles as per duty factors S3 to S7 and duty cycle factor.
- Load torque variation during motor acceleration and braking (in graphical form).
- Moment of inertia of the load on the motor shaft.
- Type of braking (eg mechanical, electrical through phase reversal or DC injection).

Permissible output

Apply the factors in the accompanying table to the output rating for motors with duty cycles that are not continuous.

		Duty cycle factor		
		For frames 80 to 132	For frames 160 to 250	For frames 280 to 355
Poles				
Short-time duty, S2				
30 min	2	1.05	1.20	1.20
	4 to 8	1.10	1.20	1.20
60 min	2 to 8	1.00	1.10	1.10
Intermittent duty, S3				
15%	2	1.15	1.45	1.40
	4 to 8	1.40	1.40	1.40
25%	2	1.10	1.30	1.30
	4 to 8	1.30	1.25	1.30
40%	2	1.10	1.10	1.20
	4 to 8	1.20	1.08	1.20
60%	2	1.05	1.07	1.10
	4 to 8	1.10	1.05	1.10

For other duties (S4, S5, S6 and S7) contact CMG for appropriate duty cycle factors.

Duty cycles

S1 Continuous duty

Operation at constant load of sufficient duration for thermal equilibrium to be reached.

S2 Short - time duty

Operation at constant load during a given time, less than that required to reach thermal equilibrium, followed by a rest (de-energised) period of sufficient duration to allow machine temperatures to reduce to within 2K of the rated inlet coolant temperature.

S3 Intermittent periodic duty with insignificant starting time

A sequence of identical duty cycles where each consists of a period of operating at constant load and a period at rest. The cycle is such that the starting current does not significantly affect the temperature rise.

S4 Intermittent periodic duty with significant starting time

Sequence of identical duty cycles where each cycle consists of a significant period of starting, a period of operation at full load and a period of rest.

S5 Intermittent periodic duty with influence of running up period and electric braking

As S4, but with each cycle including a period of rapid electric braking.

S6 Continuous periodic duty

A sequence of identical duty cycles, each cycle consisting of a period of operation at no-load. There is no rest or de-energised period.

S7 Continuous periodic duty with starting and electric braking

As S6, with each cycle including a period of starting and a period of electric braking.

Connection

A motor's rated voltage must agree with the power supply line-to-line voltage. Care must therefore be taken to ensure the correct connection to the motor terminals.

Internal connections, voltages and VF drive selection

Standard terminal connections for motors 3.0kW and below is 240V delta / 415V star. These motors are designed for 415V Direct On Line (D.O.L.) starting, when connected in the star configuration. They are also suitable for operation with 240V three phase variable frequency drives, when connected in the delta configuration.

Standard terminal connections for motors 4.0kW and above is 415V delta / 720V star. These motors are designed for 415V Direct On Line (D.O.L.) starting, when connected in the delta configuration. They are also suitable for operation with 415V three phase variable frequency drives. Alternatively they can be operated D.O.L. in the star configuration from a 720V supply or with a 720V variable frequency drive. In this case the drive must be supplied with an output reactor to protect the winding insulation. These size motors are also suitable for 415V star-delta starting as described below.

Motor connected for D.O.L. starting with bridges in place for star connection (3.0kW and below)

Motor connected for D.O.L. starting with bridges in place for delta connection (4.0kW and above).

Starting

All of the following starter options are available through CMG Drives division, and are best supplied together with the motor.

D.O.L. Starters

When an electric motor is started by direct connection to the power supply (D.O.L.), it draws a high current, called the 'starting current', which is approximately equal in magnitude to the locked rotor current I_L . As listed in the performance data, locked rotor current can be up to 8 times the rated current I_N of the motor. In circumstances where the motor starts under no load or where high starting torque is not required, it is preferable to reduce the starting current by one of the following means.

Star - Delta starting

SGA motors 4.0kW and above are suitable for the star-delta starting method. Through the use of a star-delta starter, the motor terminals are connected in the star configuration during starting, and reconnected to the delta configuration when running.

The benefits of this starting method are a significantly lower starting current, to a value about 1/3 of the D.O.L. starting current, and a corresponding starting torque also reduced to about 1/3 of its D.O.L. value. It should be noted that a second current surge occurs on changeover to the delta connection. The level of this surge will depend on the speed the motor has reached at the moment of changeover.

Electronic soft starters

Through the use of an electronic soft starter, which controls such parameters as current and voltage, the starting sequence can be totally controlled. The starter can be programmed to limit the amount of starting current. By limiting the rate of the current increase the startup time is extended. This starting method is particularly suitable for centrifugal loads (fans and pumps).

VVVF Drives

The SGA motor performs excellently without cogging at low speed when operating in conjunction with a VVVF (Variable Voltage Variable Frequency) drive. VVVF drives are primarily recognized for their ability to manipulate power from a constant 3 phase 50/60Hz supply converting it to variable voltage and variable frequency power. This enables the speed of the motor to be matched to its load in a flexible and energy efficient manner. The only way of producing starting torque equal to full load torque with full load current is by using VVVF drives. The functionally flexible VVVF drive is also commonly used to reduce energy consumption on fans, pumps and compressors and offers a simple and repeatable method of changing speeds or flow rates.

For operation below 25Hz motor cooling fan efficiency drops significantly. Hence, in constant torque applications, a separately driven cooling fan should be fitted to provide sufficient cooling of the motor.

For operation between 25Hz and 50Hz speed range the motor is capable of delivering full rated torque with its standard fan.

For operation above 50Hz, all SGA motors are capable of delivering constant rated power up to 60Hz. However, most of these motors are suitable to run and deliver constant power at much higher frequencies than 60Hz to a maximum of 100Hz. In the case of applications between 60Hz and 100Hz please contact CMG for advice on suitability.

The SGA range of motors will operate without modification on VVVF drives however under certain conditions additional features should be considered (see EDM Concerns). The graph below shows the SGA motors' loadability with a frequency converter:

EDM concerns

Capacitive voltages in the rotor can be generated due to an effect caused by harmonics in the waveform causing voltage discharge to earth through the bearings. This discharge results in etching of the bearing running surfaces. This effect is known as Electrical Discharge Machining (EDM). It can be controlled with the fitment of appropriate filters to the drive.

To further reduce the effect of EDM, an insulated non drive bearing can be used. CMG recommends the use of insulated bearings for all motors 315 frame and above.

Insulation

Standard SGA series motors are wound with F class insulation and winding designs limit the temperature rise to 80K (unless otherwise noted) for which B Class insulation would normally be sufficient. The use of F class insulation provides an additional safety margin of 25K, as shown in the accompanying table, together with an extended operating life.

	Insulation class		
	B	F	H
Max. permissible winding temp. (°C)	130	155	180
Less ambient temp. (°C)	-40	-40	-40
Less hotspot allowance (K)	-10	-10	-15
Equals max. permissible temp.rise (K)	80	105	125
Less max. design temp. rise (K)	-80	-80	-80
Equals min. safety margin (K)	-	25	45

The SGAH version will provide a safety margin of 45K and can be safely operated at elevated ambient temperatures.

Due to their conservative design many sizes in the SGA range of motors have temperature rises considerably less than 80K and therefore provide even greater safety margins.

Thermal protection

Motors can be protected against excessive temperature rise by inserting, at various positions within the windings, thermal probes which can either give a warning signal or cut off the supply to the motor in the event of a temperature abnormality.

The units fitted to SGA motors, frame sizes 160 and above, are PTC thermistors. These thermovisible resistors, with positive temperature co-efficient, are fitted one per phase, series connected and are terminated in a terminal strip located in the terminal box. Trip temperature is 160°C (180°C for SGAH series). Additional 130°C thermistors can be fitted as an option for alarm connection.

Speed at partial loads

The relationship between motor speed and degree of loading on an SGA motor is approximately linear up to the rated load. This is expressed graphically in the accompanying drawing.

Where:

n_N = full load speed
 n_s = synchronous speed
 P/P_N = partial load factor

Current at partial loads

Current at partial loads can be calculated using the following formula:

$$I_x = \frac{P_{out_x}}{\sqrt{3} \times U_N \times \cos \phi_x \times \eta_x} \times 10^5$$

Where:

I_x = partial load current (amps)
 P_{out_x} = partial load (kW)
 U_N = rated voltage
 $\cos \phi_x$ = partial load power factor
 η_x = partial load efficiency (%)

Torque characteristics

Typical characteristics of torque behaviour relative to speed are shown in the torque speed curve example below.

Where:

T_N = full load torque
 T_L = locked rotor torque
 T_U = pull-up torque
 T_B = break down torque
 n_N = full load speed
 n_s = synchronous speed

SGA motors all exceed the minimum starting torque requirements for Design N (Normal torque) as specified in IEC60034-12, and in most cases meet the requirements of Design H (High torque).

Rated torque can be calculated with the following formula:

$$T_N = \frac{9550 \times P_N}{n_N}$$

Where:

T_N = full load torque (Nm)
 P_N = full load output power (kW)
 n_N = full load speed (r/min)

Installation, operation & maintenance

For a copy of the SGA Installation, Operation & Maintenance manual, please contact CMG or download from our website at www.cmgroup.com.au.

Installation, operation & maintenance

The CMG SGA series motors are designed and manufactured to be robust and reliable with minimal maintenance. The following items should be taken into consideration to ensure a trouble free installation and reliable running throughout the motor's life.

Inspection

CMG motors are delivered through safe and reliable transport in appropriate packing as to remain in as manufactured condition during transit. On receipt of the motor thoroughly inspect the unit for any transit damage, if need be in the presence of an insurance surveyor. Any equipment damage or shortfall should be immediately advised to the nearest CMG office.

Check the following:

- rating plate details and enclosure are as ordered,
- shaft turns freely (in absence of shaft locking clamp),
- condensation drain holes are in the correct position for the motor mounting application (they should be located at the lowest point of the motor when it is in its operating position),
- If the winding is Insulation Resistance (IR) tested to earth, ensure that the thermal protectors are not inadvertently damaged. (The thermistor leads should be shorted together whilst IR testing takes place.)

Storage

When the motor is not for immediate use store as follows:

- Clean and dry location,
- Free from vibration (vibration can damage bearings),
- Shaft locking clamps, where supplied, are fitted securely,
- Remove shaft locking clamps and turn rotor by one full rotation at least once a fortnight and replace shaft locking clamps,
- Anti-condensation heaters, where fitted, should be energised if the environment is likely to be damp.

Installation

The following items should be considered on installation to ensure reliable operation of the motor:

Surroundings

- Ensure that the motor is properly protected against ingress of oil, water or dust especially if construction work is in progress around the motor,
- Ensure air intake is not obstructed. Refer to dimension BL in the catalogue,
- When installing hazardous location motors, make sure that the zone and gas group or dust and temperature classification on motor nameplate are complied with.

Mounting

- Bed plates or slide rails should be firmly fixed to a solid, level foundation to ensure the motor remains rigid and vibration free,
- Shims or packers (if required) must be of adequate size and placed adjacent to and between base fixing screws,
- Protective transport coatings on shafts and/or flanges must be removed prior to connection to the driven load,
- A light coating of grease to shafts and/or flanges will inhibit corrosion during service and assist removal of pulleys or couplings.

Operation

- Before running the motor make sure that the terminal box lid is closed and secured with appropriate clearance to live parts,
- Make sure that appropriate earthing is done,
- Make sure that the coupling and/or transmission is adequately guarded for safety,
- Check the mounting bolts and/or flanges are firmly secured,
- Make sure of no loose objects around that may be sucked by the cooling fan on the motor,
- Make sure that the load applied is within the nameplate specification,
- Make sure that the ambient temperature is inside 40°C or nameplate specification,
- Avoid frequent starting of motor. Refer to motor catalogue or nearest CMG office for recommendation on frequency and duration of starts,
- If a VVVF drive is used on Ex nA motor, make sure that the applied load is inside the limits specified by the loadability curve shown in drawing SGA208,
- On Ex e motors, make sure that the starting method employed keeps the starting current and duration within the nameplate figures of I_A/I_N ratio and t_E time,
- Check that the running current on no load and full load are reasonably balanced within 10% of the average and record the figures in the log book for future reference. Note that the current imbalance can be higher, typically 10 times the voltage imbalance if there is an imbalance in supply voltage,
- Brake motors used in hazardous locations must have a limited number of repeat stops to 20 per hour.

Number of starts per hour

The number of starts per hour is dependant on the inertia of the driven load and the load torque demand. When high inertia load is applied (flywheel, heavy fan etc) please refer to your nearest CMG office for advice. A guide to generally acceptable starts per hour would be as per table.

For greater number of starts per hour, please contact your nearest CMG office for advice.

Frame	Starts per Hour			
	2 Pole	4 Pole	6 Pole	8 Pole
71 *	-	40	-	-
80 *	20	40	40	-
90	16	30	40	-
100	16	30	40	40
112	16	30	40	40
132	10	20	25	25
160	10	20	25	25
180	8	15	20	20
200	6	12	12	12
225	5	10	10	10
250	4	8	8	8
280	3	6	6	6
315	3	4	4	4

* 20 Starts / Hour for Ex tD brake Motors

Permitted starting time

In respect to the temperature rise of the motor, starting time (i.e., from rest to operational speed) should not exceed the time indicated in the following table. Motor must be allowed to cool prior to each start.

Note: For Ex e motors t_E time stated on motor name plate takes precedence over these times

Frame	Starting method	Maximum starting time [sec]			
		2 pole	4 pole	6 pole	8 pole
71	D.O.L.	-	26	-	-
80	D.O.L.	15	26	40	-
90	D.O.L.	10	15	25	-
100	D.O.L.	12	13	18	40
112	D.O.L.	10	10	18	35
132	D.O.L.	14	12	12	25
160-355	D.O.L.	15	15	20	20
160-355	Star-delta	45	45	60	60

Sealed bearings

The required replacement interval for sealed bearings is generally determined by the grease life which is dependant on operating temperature, operating speed, the limiting speed of the bearing and the type of grease. Under normal operating conditions the following relationship applies:-

$$t = 654 - 26 \frac{n}{N} - (0.025 - 0.012 \frac{n}{N}) T$$

Where:

t = Average grease life (hours)

n = Speed (RPM)

N = Bearing limiting speed with grease lubrication (RPM)

T = Operating temperature (°C)

For further information, please contact your nearest CMG office for advice.

Open (regreasable) bearings

It should be noted that for motors fitted with Ball and Roller bearings, the lubrication intervals for both bearings should be based on the roller bearing data.

The re-lubrication intervals recommended are calculated on the basis of normal working conditions.

Note: Under arduous conditions please contact CMG or the bearing manufacturers catalogue. Air operated grease guns should not be used.

Replenishment of grease media should be by means of a hand held grease gun whilst motor is running with relief plate removed.

Maintenance

Reliable, trouble free operation of a motor needs regular maintenance. Exact maintenance needs vary based on the site conditions. To obtain reliable service from the motor, the following maintenance schedule may be used as a guide. An authorised service agent must carry out maintenance of hazardous location motors SGAE, SGAN or SGAD.

- A. Ensure air intake space is unobstructed.
- B. On a weekly basis use an air hose to ensure all air ways are clear and free of dust.
- C. Once every month, check motor for condensation. Replace drain plugs before starting if they are blocked or found missing.
- D. Do not wash the motor down unless it is IP66 rated.
- E. On a quarterly basis-
 - (i) Check the motor terminals for tightness and proper contact,
 - (ii) If terminal lug/s are discoloured, re-terminate with fresh lugs,
 - (iii) Check operation of starting equipment, ensuring all terminations are tight.
 - (iv) Check mechanical operation of thermal overload relays, if any,
 - (v) Check mechanical operation of thermistor relays, if fitted,
 - (vi) Check operation of anti-condensation heaters, if fitted.
- F. On a six monthly basis, in addition to the items in 'E' -
 - (i) Check winding resistance between supply terminals and compare to original value and enter in log book.
 - (ii) Check supply voltage at motor terminals and record in log book.
 - (iii) Check bearings for abnormal noise/overheating.
- G. On an annual basis, in addition to the items in 'E' and 'F' -
 - (i) Re-grease the bearings as recommended in the following table. Frames 71-180 use sealed bearings. Frames 200-280 use open re-greasable bearings. When re-greasing bearings ensure that the correct type of grease is used. If in doubt about the existing grease type, clean out the old grease thoroughly from bearings and bearing housings, prior to regreasing.
WARNING: NEVER MIX GREASE OF DIFFERENT TYPES
Use lithium based grease such as Shell Alvania R3 or equivalent unless otherwise specified. SGAE, SGAN and SGAS motors require extra high temperature grease such as Magnalube G or equivalent.
 - (ii) Completely disassemble stator, rotor apart and clean thoroughly.
 - (iii) Check bearings for wear/damage – replace as necessary.
 - (iv) Check all bolts and nuts for cracks or damage – replace as necessary.
 - (v) Check all holding down bolts for signs of fatigue or damage – replace as necessary.
 - (vi) After re-assembly, check and record in the log book-
Insulation resistance by megger
No load current and voltages
Full load current and voltages
Ensure that these figures compare well with the original records in the log book.
 - (vii) Check and ensure that the cooling fan is operational.

Marine Approval

The complete range of SGA series standard motors are Lloyds Registered (Certificate No. 08/10039) for use in marine, offshore and industrial applications.

SGA motors as detailed in this catalogue are designed and rated for use on board merchant vessels and are generally in accordance with the requirements of major marine classification authorities.

Registered Range:

Output: 0.37kW to 315kW
 Speed: 2P, 4P, 6P, 8P & dual speed
 Voltage: 200V to 750V
 Frequency: 50Hz to 60Hz
 Ambient Temperature: 450 C
 IP Rating: IP55

Design Code Standard: IEC60034-1 & IEC60092-301

Available Options

- IP56 or IP66
- Epoxy paint finish
- Class H insulation
- Thermistors
- Anti-condensation heaters
- Winding RTD's
- Bearing RTD's
- Drain plugs
- Special shaft material or shaft design
- Stainless steel fasteners
- VVVF drive compatible

Standards for TEFC motors

Results are guaranteed only when confirmed by test results.

¹⁾ F Class temperature rise

²⁾ t_E time applies to Ex e motors only and is explained in the hazardous areas section.

³⁾ The SGAA series are supplied as standard in South Africa.

⁴⁾ The output of these motors is one step higher than the basic design with rated outputs in accordance with CENELEC.

Full load currents at various power supplies

SGA series, three phase

Specifically wound for nominated power supply

¹⁾ F Class temperature rise

²⁾ t_E time applies to Ex e motors only and is explained in the hazardous

areas section.

³⁾ The SGAA series are supplied as standard in South Africa.

⁴⁾ The output of these motors is one step higher than the basic design with rated outputs in accordance with CENELEC.

*For performance data see pages 16 & 17.
Other speeds and power ratings available on request.

Airstream rated motors for axial fans

CMG offer a comprehensive range of motors specifically built for use with axial flow fans, where the motor is mounted in the airstream.

Provided the airstream ensures ample cooling, the fan and cowl normally fitted to a standard TEFC motor is redundant. Enclosure rating of the motor is also improved with the use of a solid rear endshield.

Due to the elimination of losses associated with the motor fan these motors have a higher efficiency than standard SGA motors.

Standard mount - SGAR (B3, B5, B3/B5)

*2 pole motors only

SGARF is a popular alternative to SGAR, with the terminal box replaced by blanking plate and extended leads (see page 33 for details on blanking plates and extended leads). In this case, terminal box and block are supplied loose with motor for convenience of remote leads termination. These motors are also available in H class insulation (SGARHF).

Pad mount - SGAPR

SGAPR are SGAR style motors with standard mount replaced with pad mount.

SGAPRF is a popular alternative to SGAPR, with the terminal box replaced by blanking plate and extended leads (see page 26 for further details).

Cooling tower - SGAC

SGAC (formerly SGACT) cooling tower motors are specially developed for operation in air stream rated cooling towers. SGAC motors are available in frame sizes 71 to 355, and rated power outputs of 0.37 to 315kW.

Applications

SGAC motors are ideally suited to the cooling tower application, in industries such as food and beverage, airconditioning, chemical processing, and petrochemical.

Protection

CMG SGAC motors have a protection rating of IP66 for maximum protection against water and dust.

Additional enhancements

- 2 part epoxy coated for excellent protection against corrosive solids and liquids
- Stainless steel name plate
- Corrosion protection on threads
- Extra insulation coating (Red Isonel 300)
- Shaft seal fitted
- Silastic sealed
- Non-drive end shaft extension cut and blanking plate fitted. Alternatively, SGAR used as base motor.

Paint

Standard paint finish for SGAC motors is a 2 part epoxy RAL 9005 Jet Black paint. CMG's SGAC range of cooling tower motors combine the SGA's standard high strength and high efficiency with significant enhancements to give the perfect motor for cooling tower applications.

Smokespill - SGAS/SGAHS

Smokespill application motors are designed to withstand the extreme environmental conditions associated with a building fire. Ventilation systems within public buildings are required to continue providing smoke extraction for 2 hours at smokespill air temperature of 200°C or for 30 minutes at 300°C, designated respectively as rating-1 or rating-2 in accordance with AS/NZS1668.1.

The standard SGAS range (formerly SGASS), wound with F class insulation in frame sizes 80A to 180L, meet the rating-1 requirements. SGAHS range, wound with H class insulation in frame sizes 80A to 315L, meet either rating-1 or rating-2 requirements. SGAHS range is also suitable for applications at 300°C for 2 hours.

Smokespill features

The standard SGA motor is inherently suitable for upgrading to the smokespill application due to its low temperature rise. When SGAS motors are ordered F class motors are modified and when SGAHS motors are ordered H class motors are modified in accordance with our standard operating procedures which include the following:

- C3 internal clearance bearings lubricated with extra high temperature specification grease
- Special name plate specifying smokespill suitability
- Double insulated terminal leads
- Double varnish system for winding crown
- Fan and cowl removed if present on the original motor; cowl may sometimes remain to protect from bare shaft
- Motors tested prior to despatch
- Extra High Temperature Grease (Magnalube G)

Certification and testing

Australian standard AS4429 specifies the methods of test and rating requirements for smokespill fans. A range of motors was selected in consultation with a competent authority on this subject. Testing of motors was carried out in a specially designed re-circulating duct system. The test rig and the methods of test were also witness approved by a competent authority. A series of tests were conducted to certify our entire range of SGAS and SGAHS motors.

T.E.A.S.R. (Totally Enclosed Air Stream Rated - no fan or cowl)

The SGAS range is normally supplied without fan and cowl, relying on the air flow generated by the driven fan to provide the necessary cooling during normal operation thereby ensuring high temperature operation will not cause the plastic fan to melt.

Motors are normally supplied with the non drive end stub shaft exposed, as it is expected to be shrouded by the fan housing and duct work when installed. If this presents a problem in a specific application, either removal of this shaft can be requested, or the standard fan cowl can be fitted, but without the motor fan. Alternatively the SGAR series can be used as the base motor.

Terminations

SGAS motors can be supplied either with terminal boxes or with extended leads through a gland plate (see page 33 for details). In either case, it is the installers responsibility to ensure that suitable high temperature leads, conduit and fittings are installed to take the motor leads outside the fan case. CMG can supply terminal boxes and terminal blocks for installation outside the fan drum if required.

Paint

Standard color finish for the SGAS range is RAL 7012 Basalt Grey, and RAL 3000 Flame Red for the SGAHS range. Other colors are available on request.

Nameplates

CMG Smokespill motors are marked with special nameplates labelling its suitability for smokespill duty and stating specific temperature condition ratings and lubrication details. Additional plates for external mounting to fan assemblies are available on request.

Maintenance

Because of the safety related nature of smokespill motors proper maintenance schedules are imperative, especially where the motor is used for dual purposes ie. continuous running for normal ventilation as well as for smokespill application. Serious consideration needs to be given to bearing and insulation deterioration caused by use for extended periods for normal ventilation duty. It is important that the motor remains within its stated rating both on initial commissioning and after any adjustments to the ventilation system.

Brake motors - SGAB

CMG offer a wide range of Brake motors, SGAB, from frame size 71 through to 180. 4 pole models are stocked as standard. 2,6 and 8 pole and other non-standard sizes and speeds are available on special order.

SGAB brake motors are “fail to safe” design, as the brake will engage when power is interrupted.

Brake motors are designed for use in applications requiring rapid stopping, holding and position control.

SGAB motors are available in all mounting arrangements. Brakes are made to the ‘Euro’ standard mounting dimension, providing interchangeability with other brands. Cast iron brake enclosures for hazardous locations are also available.

Dimensions

The only dimensional variations of SGAB from SGA is the overall motor length, due to the extended length of the cowl. These dimensional variations are listed in the accompanying table. Overall length L is replaced by LB.

Motor frame	Brake motor overall length [LB]
71	296
80	341
90S	372
90L	397
100L	448
112M	473
132S	573
132M	613
160M	700
160L	745
180M	790
180L	827

Connection

SGAB motors 3kW and below are connected in 415V star connection with brake connected as shown below left. SGAB motors 4kW and above are connected in 415 volt delta connection with brake connected as shown below right.

The SGAB 3 phase motor is fitted with a CE certified DC brake and half wave rectifier mounted in the terminal box enabling direct connection of the brake to the AC supply.

Where response time is important, this time can be improved by switching the brake on the DC current side of the rectifier. These additional terminals are standard on the rectifier fitted to the 160 to 180 frame motors as shown below.

Brake details

Output kW	Motor frame	Brake model	Brake weight [kg]	Motor full load torque T_N [Nm]	Brake torque [Nm]			Brake torque [% of full load]		
					Nominal	Min	Max	Nominal	Min	Max
0.37	71B-4	M4	1.1	2.6	4	1.4	5	150%	50%	190%
0.55	80A-4	M8	1.8	3.7	8	2.8	10	220%	80%	270%

22	180L-4	M250	33.0	142	250	90	310	180%	60%	220%

For further technical details regarding the brake, please contact your nearest CMG office.

Motors for hazardous areas

SGAE/SGAN/SGAD

Motors used within a hazardous location require a higher level of protection against the risk of harmful occurrences. CMG SGA motors are available in the three most common high protection configurations, Ex e, Ex nA (formerly Ex n) and Ex tD (formerly DIP), supplied with protection ratings IP55, IP65 or IP66. SGA Hazardous area motors are available in motor frame sizes 71 to 280, with 315 frame certificate pending (Ex nA and Ex tD only). Combinations of protection such as Ex e and Ex tD or Ex nA and Ex tD are also available.

International and Australian standards

IEC or AS/NZS 61241.1 and AS 2381.1 specify general requirements for the selection of electrical equipment, and its installation and maintenance to ensure safe use in areas where flammable materials are generated, prepared, processed, handled, stored or otherwise used, and which are therefore potentially hazardous.

The term 'flammable material' includes gases, vapors, liquids, mists, solids and dusts, but does not include those materials which are specifically manufactured as explosives or materials which are inherently explosive. The requirements of the listed standards apply only to the use of electrical equipment under normal or near normal atmospheric conditions.

The requirements specified for hazardous location electrical equipment are supplementary to and not alternative to any requirements which would apply to equipment and installations in non-hazardous areas (see AS/NZS3000).

European Standards

European standards 'EN' series are closely aligned with IEC standards. They share the same numbering and require assessment and certification to ATEX directives, issued by the European Union.

The ATEX directive (94/9/EC, 23.03.94) addresses both the compliance of hazardous area equipment to specified standards, and the compliance to EH&SR (Essential Health & Safety Requirements).

Paint

Standard color finish for the hazardous area range is RAL 7012 Basalt Grey, with primary option of RAL 1004 Golden Yellow for SGAE. Other colors are available on request.

Motor protection types

SGAE - Ex e

Ex e motor protection designates Increased safety as outlined in IEC, EN or AS/NZS 60079-7.

The increased safety (Ex e) type of protection describes electrical equipment that does not produce arcs or sparks in normal service in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

Increased safety (Ex e) motors are suitable for Class I, Zone 1, Group II (A,B&C) hazardous areas, and CMG provides for a temperature class of T3 (200°C) in a 40°C ambient (see next page for explanations of classes, zones and groups).

Ex e Protection - t_E time

t_E time is the time it takes for the stator winding or rotor cage to heat up from normal operating temperature, at the highest permitted ambient temperature, to the highest permitted limit temperature (temperature class), with the rotor locked and the stator winding loaded with the starting current.

For selection and setting of suitable current dependent protection the t_E time and the ratio of locked rotor current to nominal current are used. In the case of a rotor locking, this device must cut off the supply within the specified t_E time, which is listed in the performance data.

SGAN - Ex nA (formerly Ex n)

Ex nA motor protection designates Non-sparking as outlined in IEC, EN or AS/NZS 60079-15. Non-sparking (Ex nA) type of protection describes electrical equipment that, in normal operation, is not capable of igniting a surrounding explosive atmosphere, and a fault capable of causing ignition is not likely to occur.

Non-sparking (Ex nA) motors are suitable for Class I, Zone 2, Group II (A,B&C) hazardous areas, and CMG provides for a temperature class of T3 (200°C) in a 50°C ambient.

SGAD - Ex tD (formerly DIP)

Ex tD motor protection designates dust-excluding ignition proofing as outlined in IEC or AS/NZS61241 series of standards.

Dust-excluding ignition proofing (Ex tD) type of protection describes electrical equipment which is enclosed so that it excludes dust, and which will not permit arcs, sparks or heat otherwise generated or liberated inside the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specific dust on or in the vicinity of the enclosure.

Dust-excluding ignition proofed (Ex tD) motors are suitable for Zone 21 and 22 dust laden hazardous areas, and CMG provides for a temperature class of T4 (135°C) in a 50°C ambient.

Hazardous area classifications

Hazardous areas fall into two categories; hazards due to flammable gases (vapors or mists), and hazards due to combustible dusts (fibres or particles).

Gaseous hazards

Explosive gas atmospheres are classified into zones based on the frequency and duration of their occurrence as below:

Zone 0: an area in which an explosive gas atmosphere is present continuously, for long periods, or is present frequently.

Zone 1: an area in which an explosive gas atmosphere is likely to occur in normal operation occasionally.

Zone 2: an area in which an explosive gas atmosphere is not likely to occur in normal operation, and if it does occur it will exist for a short period only.

Electrical apparatus for potentially explosive atmospheres is divided into the following groups:

Group I: mines susceptible to fire damp (methane).

Group II: other industries.

High surface temperatures can cause ignition of flammable gases or vapors therefore the surface temperature of equipment in hazardous areas must not exceed the ignition temperature of these gases or vapors.

Group I electrical equipment may not have a surface temperature that exceeds 150°C where coal dust can form a layer, and 450°C for internal surfaces where the above risk is avoided by sealing against ingress or dust.

Group II electrical equipment may not have a surface temperature that exceeds its specified temperature class, as listed in the table below:

Temperature class of electrical equipment	Maximum surface temperature of electrical equipment	Ignition temperature of gas or vapor
T1	≤ 450°C	> 450°C
T2	≤ 300°C	> 300°C
T3	≤ 200°C	> 200°C
T4	≤ 135°C	> 135°C
T5	≤ 100°C	> 100°C
T6	≤ 85°C	> 85°C

Electrical apparatus of Group II may be subdivided according to the nature of the potentially explosive atmosphere for which it is intended.

Group specification and characteristics of some common flammable liquids, gases, and vapors are listed in the table below:

Material	Boiling point [°C]	Flash point [°C]	Ignition temp. [°C]	Gas group
Acetone	56	-20	465	IIA
Acetylene	-83	Gas	305	IIC
Ammonia	-33	Gas	651	IIA
Benzene	80	12	498	IIA
Butane	-1	Gas	287	IIA
Carbon monoxide	-192	Gas	609	IIA
Ethane	-89	Gas	472	IIA
Ethyl alcohol	78	55	363	IIA
Ethylene	-104	Gas	450	IIB
Heptane	98	-4	204	IIA
Hydrogen	-252	Gas	500	IIC
Hydrogen cyanide	26	-18	538	IIB
Methane	-162	Gas	537	IIA
Propane	-42	Gas	432	IIA
Toluene	111	4	480	IIA

Note: The data given in this table is derived from NFPA 325M. Flashpoint is the lowest temperature at which a material gives off sufficient vapor to form an explosive gas/air mixture in the air immediately above the surface.

Equipment within a specific group may only be used within a location with an equal or less level of hazard. Allowable groups are summarized in the table below:

Gas group	Allowable equipment group
IIA	IIA, IIB, IIC
IIB	IIB, IIC
IIC	IIC

Combustible dust hazards

Many dusts which are generated, processed, handled and stored, are combustible. When ignited, they can burn rapidly and with considerable explosive force if mixed with air in the appropriate proportions. Electrical apparatus used in locations where this hazard is present, requires adequate protection so as to reduce the likelihood of ignition of the external explosive atmosphere.

Areas where dusts, flyings and fibres in air occur in dangerous quantities are classified as hazardous and are divided into three zones according to the level of risk.

Zone 20: An area in which combustible dust, as a cloud, is present continuously or frequently during normal operation, in sufficient quantity to be capable of producing an explosive dust/air mixture, and/or where layers of dust of uncontrollable and excessive thickness can be formed.

Zone 21: An area not classified as Zone 20 in which combustible dust, as a cloud, is likely to occur during normal operation, in sufficient quantities to be capable of producing an explosive dust/air mixture.

Zone 22: An area not classified as Zone 21 in which combustible dust clouds may occur infrequently, and persist for only a short period, or in which accumulations or layers of combustible dust may be present under abnormal conditions and give rise to combustible dust/air mixtures. Where, following an abnormal condition, the removal of dust accumulations or layers cannot be assured then the area is to be classified.

Ignition protection is based on the limitation of the maximum surface temperature of the enclosure and on other surfaces which could be in contact with dust and on the restriction of dust ingress into the enclosure by the use of dust tight or dust protected enclosures.

The following table summarizes the relationship between temperature class, surface temperature and cloud or layer ignition temperature (whichever is the lower).

Temperature class of electrical equipment	Maximum surface temperature of electrical equipment	Cloud or layer ignition temperature of dust
T1	≤ 450°C	≥ 500°C
T2	≤ 300°C	≥ 350°C
T3	≤ 200°C	≥ 250°C
T4	≤ 135°C	≥ 185°C
T5	≤ 100°C	≥ 150°C
T6	≤ 85°C	≥ 135°C

Specifications and characteristics of some common combustible dusts are listed in the table below:

Material	Minimum ignition energy [mJ]	Ignition temperature	
		Cloud [°C]	Layer [°C]
Aluminium	15	550	740
Cellulose	80	480	270
Corn	40	400	250
Flax	80	230	430
Polypropylene	30	420	-
Rayon	2400	520	250
Rice	50	440	220
Rubber (synthetic)	30	320	-
Sugar	30	370	400
Wheat flour	50	380	360

Slide rails

Slide rails are designed for motor position adjustment when belt drives are used. Applications include tension adjustment for belt driven equipment.

CMG stock slide rails to suit frame sizes 80 to 355. Rail sets are manufactured from cast iron and provided with mounting bolts and nuts between motor and rail.

Slide rail dimensions

Modifications, variations and optional extras

CMG offers an extensive range of variations to the SGA motor series. Other SGA ranges outlined in other sections include:

Multi-speed

Brake motors - **SGAB**

Smokespill applications - **SGAS** and **SGAHS**

Airstream motors for axial fans - **SGAR**, **SGARF** and **SGARHF**

PAD mount airstream motors for axial fans - **SGAPR** and **SGAPRF**

Cooling tower motors - **SGAC**

Hazardous area motors - **SGAE**, **SGAN** and **SGAD**

Additional to these motor ranges CMG offer a large array of modifications available on order. These modifications are outlined below.

Terminal box

SGA motors come standard with a terminal box on the right hand side viewed from drive end. The following alternatives are available:

- Left hand terminal box - **SGAL**
- Top mounted terminal box - **SGAT**
- Removed terminal box (fitted with a blanking plate and threaded conduit entry. Extended leads, including earth connector) - **SGAF**

Extended leads: 1.5m
No. of power leads: 3+1 for up to 3kW,
6+1 for 4kW and above

Motor frame	Conduit size
71-132	M25 x 1.5
160-180	M32 x 1.5
200-250	M50 x 1.5
280-315	M63 x 1.5

Bearings

CMG can address applications where bearings need special consideration. Attention may need to be given to the following:

- Bearing monitors
- Alternative bearing types
- Low/high temperature bearing grease
- Oil seals
- Non contact labyrinth seals
- Insulated bearings

Shafts

SGA motors come standard with a single output shaft to standard dimensions. The following alternatives are available:

- Double shaft extension
- Special shaft extension
- Stainless steel shaft material type
- Reduced shafts for geared motors - **SGAG**
[Also available with smaller flange – **SGAGA**]

Environmental considerations

Where environmental factors need special consideration CMG can provide the following modifications:

- Winding temperature monitors and thermistors
- Anti-condensation heaters
- Separately powered cooling fans
- Tropic proofing
- Special paint finish
- Higher International Protection ratings, IP56, IP65 and IP66
- High ambient temperature motors – **SGAH** with H class insulation

Special performance

CMG has the ability to provide SGA motors with special windings. These may include:

- 10, 12, 16 and 24 pole single speed windings.
- Three and four speed windings.
- Windings for alternative operating voltages and frequencies.
- Windings designed for increased outputs and short time ratings.

VVVF drives

Two types of VVVF drives kit are available for the SGA range to assist in maintaining satisfactory operation.

VVVF drive kit A - Separately driven cooling fan (240 & 415V)

This fan should be used when the motor speed is required to be reduced below 25Hz in constant torque mode. For centrifugal fan or pump, no separate cooling fan is required. For all other loads refer to the loadability curve in the section on VVVF Drives, refer page 14.

VVVF drive kit B - Standard motor (EDM)

This kit incorporates a single insulated bearing, normally at the non-drive end, designed to remove the effect of electrical discharge through the bearings.

Testing services

CMG can provide both type test certificates and individual motor test reports on any CMG SGA motor. Testing is carried out by CMG Technology Pty Ltd in our own NATA and ILAC accredited test laboratory.

A 14396

Type test reports and outline drawings of standard motors are available at www.cmgroup.com.au.

Two speed motors

The CMG range of SGA two speed motors, includes both constant torque and fan duty designs. Wound with either a single winding (requiring appropriate switchgear) or separate windings designed for D.O.L. connection on each speed.

High speed	Low speed		High speed		Low speed

75	25	315S-6	1480	128	990	44.7
90	30	315MA-6	1480	154	990	54
110	36	315LA-6	1480	188	990	64
132	44	315LB-6	1480	226	990	79

Whilst we offer all 2 speed combinations (refer product code specifications on page 4) we list below the main two speed fan duty requirements.

High speed	Low speed		High speed		Low speed	
[kW]	[kW]	Frame	[r/min]	[A]	[r/min]	[A]

1500/750 r/min = 4/8 Poles

Fan duty – single winding 人 人 / 人 (MAK)

0.6	0.12	80B-4	1410	1.7	670	0.57
0.8	0.16	90S-4	1430	2.0	700	0.70
1.2	0.24	90L-4	1430	2.9	700	1.0

SOLUTIONS, not just products

NEED AN EXTRA PRODUCT TO COMPLETE YOUR PROJECT?

Truly a one stop destination, at CMG we offer a comprehensive range of products, including associated accessories, for a wide range of industries.

Ask us about our speciality products:

- » **Electric Motors**
- » **Gear Motors**
- » **AC Drives**
- » **Softstarters**

☒ ELECTRIC MOTORS

- | | |
|--|---|
| <input type="checkbox"/> HGA series | Enhanced performance cast iron units MEPS2 (Eff 1) compliant |
| <input type="checkbox"/> SGA series | Enhanced performance cast iron units |
| <input type="checkbox"/> HLA series | Cast aluminium multi-mount units MEPS2 (Eff 1) compliant |
| <input type="checkbox"/> SLA series | Cast aluminium multi-mount units |
| <input type="checkbox"/> PPA series | High specification cast iron units |
| <input type="checkbox"/> XPA series | High specification / Premium efficiency cast iron units |
| <input type="checkbox"/> PPD series | Zone 1 Exd cast iron units |
| <input type="checkbox"/> MT series | Cast aluminium single & three phase units |
| <input type="checkbox"/> CT series | Air movement, pumping & general purpose application motors |
| <input type="checkbox"/> CW series | Australian made, special application & general purpose motors |
| <input type="checkbox"/> Centurion series | HTE & HCA series cast iron and fabricated steel high voltage motors |
| <input type="checkbox"/> MTx series | Cast aluminium single & three phase units - Extended range up to 200 frames |

☒ AC DRIVES & SOFTSTARTERS

- | | |
|--|----------------------------------|
| <input type="checkbox"/> Vacon NX | Vacon frequency converters |
| <input type="checkbox"/> Lovato ADX | Softstarters with torque control |

☒ GEAR MOTORS

- | | |
|---|--|
| <input type="checkbox"/> Nordbloc-HGA | Euro dimension inline units |
| <input type="checkbox"/> Nordunicase-HGA | Heavy duty inline and flat helical units |
| <input type="checkbox"/> Nordbevel-HGA | Heavy duty helical bevel units |
| <input type="checkbox"/> Nordworm-HGA | All cast iron motor & wormbox units |
| <input type="checkbox"/> FRT-MTT/HLA | All aluminium universal mount wormbox units |
| <input type="checkbox"/> FRS-HGA | All cast iron motor & wormbox units |
| <input type="checkbox"/> FRS-MTT/HLA | All aluminium motor & wormbox units |
| <input type="checkbox"/> FRD-MTT/HLA | All aluminium Euro dimension inline units |
| <input type="checkbox"/> C&H SLA | High ratio inline multi-stage spur units |
| <input type="checkbox"/> Cycloid 600 | Compact High Efficiency Cycloidal speed reducers |
| <input type="checkbox"/> Geardrive | C-frame sub-fractional horsepower units |
| <input type="checkbox"/> SMR® | Helical shaft mounted reducers |
| <input type="checkbox"/> CRT-MTT/HLA | All aluminium universal mount wormbox units |
