

Introduction Of Filtration System

The filtration is a physical – chemical process for separating suspended and colloidal Impurities from water by passage through a bed of granular material water fills the pores of filter medium, and the impurities are adsorbed on the surface of the grains or trapped in the opening.

Filters that are designed for the particle filtration are usually pre-coat filters, sand and gravel, and activated carbon. Sand filter is applied for removal of suspended solid, turbidity whereas activated carbon is applied for adsorption of residual chlorine and organic matted even oxidizing agent or organic solvent , which we can select the filter medias inside follow requirement.

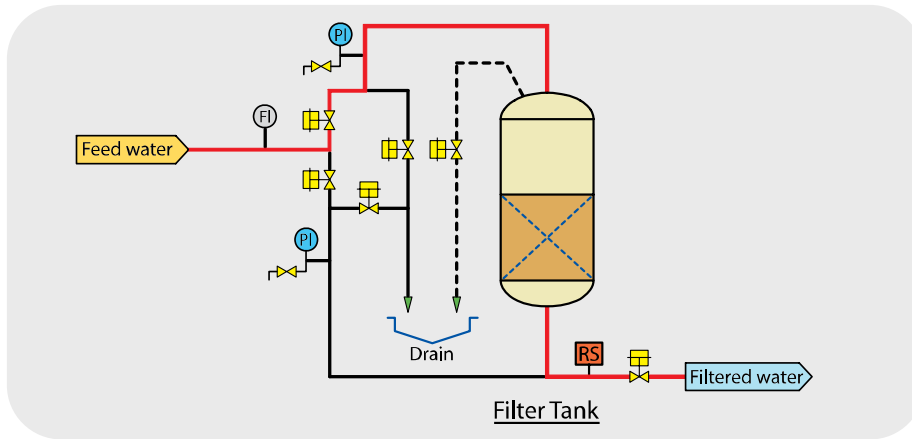

Product Features

- ▶ Available choose manual type or automatic type.
- ▶ Inside filter tank lining by epoxy for corrosive prevention.
- ▶ Life – time of filter tank very long.
- ▶ Vent and drain vales configured for easy cleaning and efficient sampling.
- ▶ Easy to operation and maintenance.
- ▶ Low running cost.

Product Applications

1. First developed to purify surface water Sources for drinking.
2. Pretreatment for reverse osmosis (RO), Deionization (DI), Ultra Deionization(UDI).
3. Pretreatment of industrial water for boiler, processing and cooling tower.
4. Treatment of recycling water for cooling tower.
5. Tertiary treatment for wastewater treatment plant.
6. Others.
