

ANTIBAC-E TREATMENT

At Euro Air we manufacture textile ducting for a wide variety of industries, including the food industry. Our textile ducting is hygienic and easy to maintain, with a high dust holding capacity which allows long washing intervals.

Especially in food industry environment where are essential high standards of hygiene, our textile ducts are well suited because of their low probability of condensation and material made of polyester, which prevents the growth of microorganisms.

In more humid environments such as slaughterhouses, dairies and cold stores, our innovative Antibac-E washing process eliminates microbial contamination while avoiding the use of silver ions that can be hazardous to the environment.

Our Antibac-E treatment offers complete hygienic treatment of the entire system, preventing the growth of microbial substances for up to 3 wash cycles and is approved in accordance with EN ISO 20645:2004 and EN ISO 20743:2013. The solution that we use is environmentally friendly and does not contain any dangerous chemicals.
