### 30L,60L water tank for lab water purification system

- 1.Made of polyethylene material and blow molding process, no adhesives or surfactants are used in the manufacturing process.
- 2.The sealed and oversized water tank cover prevents air from entering the water tank and facilitates manual cleaning; the polyethylene material greatly avoids the dissociation of small molecules.
- 3.The internal surface of the water tank is smooth, making it difficult for biofilm to grow; the cylindrical shape reduces the internal surface area of the barrel, thereby reducing contact with pure water.
4. Water enters from the bottom of the barrel to ensure minimal carbon dioxide absorption, and the conical bottom of the barrel can be completely drained to ensure thorough cleaning (a drain valve is set at the bottom).
5. Use with optional accessories: the air filter can absorb CO2 and organic matter, filter bacteria, particulate matter, etc.; the ultraviolet lamp can control microorganisms and reduce organic matter (TOC) content.
